KanchoAI — Subscription Architecture Workflow

Complete user journey from plan selection to authenticated admin dashboard

1 User Selects Plan

`Landing page → selectPlan() → Signup Modal`

KANCHO INTELLIGENCE

$197/month · 2,000 AI tokens

Phone agent, dashboard, analytics, 1 school

KANCHO PRO

$397/month · 7,500 AI tokens

Everything in Intelligence + priority support

User clicks **"Get Started"** → `selectPlan('intelligence')` or `selectPlan('pro')` → opens signup modal

▼

2 Signup Form Submission

`handleSignup() → POST /api/v1/bridge/checkout/initiate`

First Name | Last Name

Email

Password (min 8 chars)

Phone | School Name

Martial Art Type | City / State

Continue to Checkout →

3 Backend: Validate & Create Stripe Session

bridge-checkout.js → POST /initiate

- **Validate** — all required fields, plan exists, password ≥ 8 chars
- **Check duplicates** — no existing User or KanchoSchool with same email
- **Hash password** — bcrypt, 12 salt rounds
- **Create Stripe Checkout Session** — mode: `subscription`, 14-day trial, $197 or $397/mo
- **Save KanchoPendingSignup** — stores all form data + Stripe session ID, status: `pending`, expires 24h

```
Response: { success: true, url: "https://checkout.stripe.com/c/pay/..." }
```

▼

4 Stripe Hosted Checkout

User redirected to stripe.com → enters payment → completes

🔒 **Stripe Checkout**

Kancho Intelligence — **$197/month** with **14-day free trial**

Card Number · Expiration · CVC

success_url → `/kanchoai/signup-success?session_id={CHECKOUT_SESSION_ID}`
cancel_url → `/kanchoai/pricing?canceled=true`

5a Stripe Webhook Fires

`POST /webhooks/kancho-stripe (src/app.js)`

- Event: `checkout.session.completed`
- Verify Stripe signature with `STRIPE_KANCHO_WEBHOOK_SECRET`
- Confirm `metadata.product === 'kancho_ai'`
- Return `{ received: true }` immediately
- Trigger async `processKanchoSignup(session)`

5b User Sees Provisioning Screen

`Redirect → /kanchoai/signup-success?session_id=...`

- ✓ Processing payment...
- ✓ Creating your account...
- ⟳ Setting up your AI phone number...
- ○ Configuring your business profile...
- ○ Building your school dashboard...
- ○ Training your AI voice agent...
- ○ Finalizing subscription...
- ○ All set!

Polls `GET /checkout/status/{sessionId}` every 2s (max 90 attempts / 3 min)

6 Async Provisioning — 8 Steps

`bridge-checkout.js → processKanchoSignup(session)`

1. **Create User** (RinglyPro DB)
   email, password_hash, plan: 'growth'/'professional', status: 'trialing', tokens: 2000/7500, stripe_customer_id
2. **Provision Twilio Phone Number**
   Purchase US number → configure voice/SMS webhooks → friendly name: "KanchoAI - {school_name}"
3. **Create Client** (RinglyPro DB)
   Link to User, store Twilio number, business hours (9am–9pm Mon–Sat), custom AI greeting, booking_enabled: true
4. **Create Credit Account**
   balance: 0.00, free_minutes_used: 0
5. **Create KanchoSchool** (Kancho DB)
   name, owner, location, martial_art_type, plan_type, status: 'trial', trial_ends_at: +14 days, link to ringlypro_user_id
6. **Provision ElevenLabs Voice Agent** (non-fatal)
   Create school-specific AI voice agent via ElevenLabs API, store agent_id on Client
7. **Update Stripe Subscription Metadata**
   Add userId, schoolId, clientId, plan, monthlyTokens, rollover: true
8. **Generate JWT & Mark Complete**
   JWT: { userId, email, clientId, schoolId, source: 'kanchoai' } expires 7d → update PendingSignup: status='completed'

7 Status Poll Returns Complete

`GET /api/v1/bridge/checkout/status/{sessionId} → completed`

```
{
  "status": "completed",
  "step": "done",
  "token": "eyJhbGciOiJIUzI1NiIs...",
  "school": { "id": 123, "name": "Tiger Dragon Dojo", "aiNumber": "+1234567890" },
  "user": { "id": 456, "email": "owner@dojo.com", "firstName": "John" }
}
```

8 Auto-Login & Dashboard Entry

`Store JWT → checkAuth() → enterAuthenticatedMode() → loadDashboard()`

- **Store JWT** in `localStorage('kancho_ai_token')`
- **Verify token** via `GET /api/v1/bridge/auth/me` → returns school, client, user data
- **Enter dashboard** — show school name, tabs (Overview, Students, Leads, Calendar, Payments, Classes, etc.)
- **Load dashboard data** — health score, KPIs, at-risk members, hot leads, today's check-ins

Database Records Created During Signup

RinglyPro DB (CRM_DATABASE_URL)

Kancho DB (DATABASE_URL)

User

id, email, password_hash, plan, subscription_status: 'trialing', tokens_balance, stripe_customer_id, stripe_subscription_id

KanchoSchool

id, name, owner_email, martial_art_type, plan_type, status: 'trial', trial_ends_at, ringlypro_user_id → User, ringlypro_client_id → Client

Client

id, business_name, ringlypro_number (Twilio), elevenlabs_agent_id, business_hours, custom_greeting, user_id → User

KanchoPendingSignup

id, stripe_checkout_session_id, email, password_hash, school_name, plan, status: 'completed', provisioning_step: 'done', result_jwt

CreditAccount

id, client_id → Client, balance: 0.00, free_minutes_used: 0

External Services Provisioned

Stripe

Customer + Subscription (14-day trial)
Metadata links to userId, schoolId

Twilio

US phone number purchased
Voice/SMS webhooks → AI agent

ElevenLabs

AI voice agent provisioned
School-specific configuration

Key Files & Endpoints

Step	File	What It Does
Plan select + form	`kancho-ai/src/index.js`	selectPlan(), handleSignup() — UI modal + form submission
Checkout creation	`kancho-ai/src/routes/bridge-checkout.js`	POST /initiate — validate, create Stripe session, save pending signup

Step	File	What It Does
Pending signup model	`kancho-ai/models/KanchoPendingSignup.js`	Stores all signup data while awaiting Stripe completion
Stripe webhook	`kancho-ai/src/routes/bridge-checkout.js`	Receive checkout.session.completed, trigger provisioning
Webhook mount	`src/app.js`	POST /webhooks/kancho-stripe — raw body for Stripe signature
8-step provisioning	`kancho-ai/src/routes/bridge-checkout.js`	processKanchoSignup() — User → Twilio → Client → School → ElevenLabs → JWT
Status polling	`kancho-ai/src/routes/bridge-checkout.js`	GET /status/{sessionId} — returns status + JWT when done
Auto-login	`kancho-ai/src/index.js`	checkSignupSuccess() — polls status, stores JWT, enters dashboard
Login (returning)	`kancho-ai/src/routes/bridge-auth.js`	POST /login — email/password → JWT → dashboard
Profile / verify	`kancho-ai/src/routes/bridge-auth.js`	GET /me — verify token, return school + client + user data
